

Problem of the Day: Solve the equation.

$$1 + 2r + r + 6 = 6(r - 6) - 4(r + 4)$$

$$1 + 2r + r + 6 = 6r - 36 - 4r - 16$$

$$3r + 7 = 2r - 52$$

$$13r - 47 = 20$$

$$13r = 13$$

$$r = 1$$

Plan for the Day: Collect homework week 1

Circuit on solving equations w/variables on both sides

More practice on solving equations with variables on both sides including the distributive property

Objective: We will be able to solve equations with variables on both sides with distributive property.

August is National Sandwich Month!!
